DIAGO

Slewing Bearing Code Standard (JB/T2300-1999)

Calculations of Series Selection for Slewing Bearing

1. Loading conditions of the slewing bearing:

During the period of the slewing bearing operation, because of the difference for their working states and constructions of its main machine, the loading of axial force F_a , radial force F_r and resultant torque M may be acted as one factor only, or two and or three factors jointly action respectively.

In general condition, the installing methods for slewing bearings are divided into two types of horizontal installation and suspended installation. See figure 1.

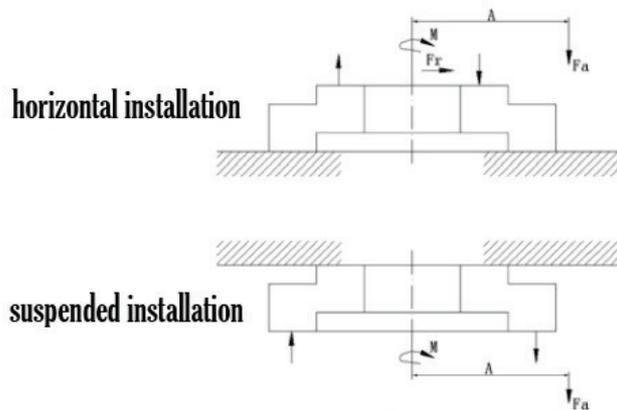

figure 1

2. Technical Date for selecting the series of slewing bearing:

- (1) Loading value that the slewing bearing should be support.
- (2) Time percentage of the every load may be occupied during the operation.
- (3) The rotation speed and rotation number of the slewing bearing at the operation condition.
- (4) Periphery forces that the gear should be supported on.
- (5) The installation dimensions.
- (6) Other technical references concerned.

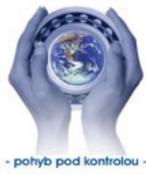

3. Selection the proper series depending to the loading curves:

Every model of slewing bearing in our sample bulletin has its own loading capacity curve respectively. The curves might be initially helping customers to select the revolving support they needed. The selection diagram as follows:

There are two curves within the curve diagram, which indicating the loading capability of the revolving support. The first is the static loading curve that indicates the maximum loading capability when revolving support is keeping static condition. The second is the dynamic loading curve that indicates the maximum loading capability when revolving support is running. Meanwhile, there are also the loading limit curves for bolts which is joining with the revolving support (Class 8.8, Class 10.9 and Class 12.9). The clamping length of the bolt is 5 times of its nominal diameters. The pre-tightening force of the bolt is determined by the materials' yield limit times 0.7.

①Determine the maximum loading of the slewing bearing during its' static state (Axial load F_a , Radial load F_r , Turnover torque M). These loads should be included the additional load and testing load.

②Determine static safety coefficient f_s according to the type of main machine (application state). See Figure One.

Calculations of Series Selection for Slewing Bearing

③ Preliminary select the series of Slewing bearing (Series of 01, 02, 13, or ...), And then calculate the F_a' and M' according to the selection.

④ Check the models of Slewing bearing that satisfied these requirements within the curve table and indicate the Coordinate points of F_a' and M' .

⑤ Check the coordinate poi

Calculations of Series Selection for Slewing Bearing

The calculation method of the forces of the axial load $F_{a'}$ and turnover torque M' for their static loadings of Slewing bearing:

1) Single-row four ball contact type

Selection and calculation for single-row four ball contact type Slewing bearing is made according to their loading angle of 45 degree and 60 degree respectively.

$$\text{I, } a = 45^\circ$$

$$F_{a'} = (1.225 \times F_a + 2.676 \times F_r) \times f_s$$

$$M' = 1.225 \times M \times f_s$$

$$\text{II, } a = 60^\circ$$

$$F_{a'} = (F_a + 5.046 \times F_r) \times f_s$$

$$M' = M \times f_s$$

2) Single-row cross arranged roller type

$$F_{a'} = (F_a + 2.05 \times F_r) \times f_s$$

$$M' = M \times f_s$$

3) Couple-row different diameter ball type

When selection and calculation of Slewing bearing, the F_r could be ignored if the $F_r \leq 10\% F_a$. But if $F_r > 10\% F_a$, it should be taken its changing of angular pressure of the rolling race. Please contact with us for these calculations.

$$F_{a'} = F_a \times f_s$$

$$M' = M \times f_s$$

4) Triple-row roller type

$$F_{a'} = F_a \times f_s$$

$$M' = M \times f_s$$

In the formulas above, where:

F_a Total axial forces acted on the Slewing bearing by main machine (KN);

F_r Total radial forces acted on the Slewing bearing by main machine (KN);

M Total turnover torques acted on the Slewing bearing by main machine (KN · m);

f_s Safety coefficient of the Slewing bearing under static working condition,
See table 1;

$F_{a'}$ Central axial forces acted on the Slewing bearing (KN);

$F_{r'}$ Radial forces acted on the S

Calculations of Series Selection for Slewing Bearing

Table 1 Safety Coefficient Table of Slewing Bearing (fs = static, fd = dynamic)

Main Machine Used			Type Slewing Bearing					
			01		02		11, 03	
			Safety Coefficient					
			fs	fd	fs	fd	fs	fd
Tower Crane	Top Revolving Type	$M_f \leq 0.5M$	1.25	1.36	1.25	1.00	1.25	1.00
		$0.5M < M_f < 0.8M$		1.55		1.15		1.13
		$M_f \geq 0.8M$		1.71		1.26		1.23
	Bottom Revolving Type				1.00	1.07		
Wheel Type Crane, Load and Unload Machine, and all kinds of Work-tables			1.10	1.36	1.10	1.10	1.10	1.10
Suspending Crane, Harbor Crane, Varies of Load and Unload machinery			1.25	1.55	1.25	1.15	1.25	1.13
Belt Conveyer used Tower Crane and Caterpillar Crane				1.71	1.10	1.26		1.23
Grab or Drawing Type Excavator, Dredger, Floating Crane			1.45	2.50	1.45	1.71	1.45	1.62
Excavator its bucket volume $\leq 1.6 \text{ m}^3$					1.75	3.00		1.25
Excavator its bucket volume $\geq 1.6 \text{ m}^3$			2.00	3.50			1.45	1.75
Crane for Metallurgy, Bucket Excavator, Tunneling Dig Machine								
Remark: The Torque could be recovered when idle time if the M_f is at its minimums range								

Calculations of Series Selection for Slewing Bearing

4. The calculation of the main machine For example : Crane (See figure II)

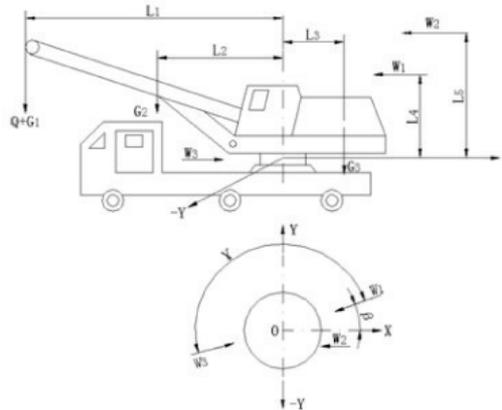

figure II

Total turnover torque $M = K \times (Q + G1) \times L1 + G2 \times L2 - G3 \times L3 + W1 \times L4 \times \cos \beta + W2 \times L5$

Total axial forces $Fa = K \times (Q + G1) + G2 + G3$

Total radial forces $Fr = W1 \times \cos \beta + W2 + W3 \times \cos \gamma$

In above formulas, where:

Q Rated loading (KN)

G1 Weight of the size changeable part. (KN)

G2 Weight of the lifting arm part (KN)

G3 Weight of the weight balancing block. (KN)

W1 Horizontal inertia force (KN)

W2 Wind force (KN)

W3 Engage force of the gear (KN)

L1 Rated working size (m)

L2 Parallel distance from the weighing center of the lifting arm part to the center of the slewing bearing (m)

L3 Parallel distance from the weighing center of the weight balancing block to the center of the

L4 Parallel distance from the acting point of Horizontal inertia force W1 to the slewing bearing (m)

L5 Parallel distance from the acting point of wind force W2 to the slewing bearing (m)

β The angle included between the horizontal inertia force W1 and the turnover torque M interacting with the X spindle.

γ The angle included between the gear engaging force W3 and the turnover torque M interacting with the X spindle.

K Working condition coefficient of the slewing bearing. (See table I)

Installing Requirement for Slewing Bearing

1、Transportation:

The Slewing bearing should be parallel placed, tightened rigidly and should not be touched or struck when it's transporting.

2、Requirement for Frame Installation:

The frame that joins and connects with the Slewing bearing is generally adopted with tube shaped construction. It is optimized to put the wall of the tube shaped body uniform with the center of rolling race as figure III:

In order to guarantee the slewing bearing running flexibility, the installing frame should have enough rigidity and strength (see table II). After welded, it must be treated to eliminate the internal stress. The installing surfaces should be machined and the plane of surfaces should be controlled within its acceptable ranging value. (See table III).

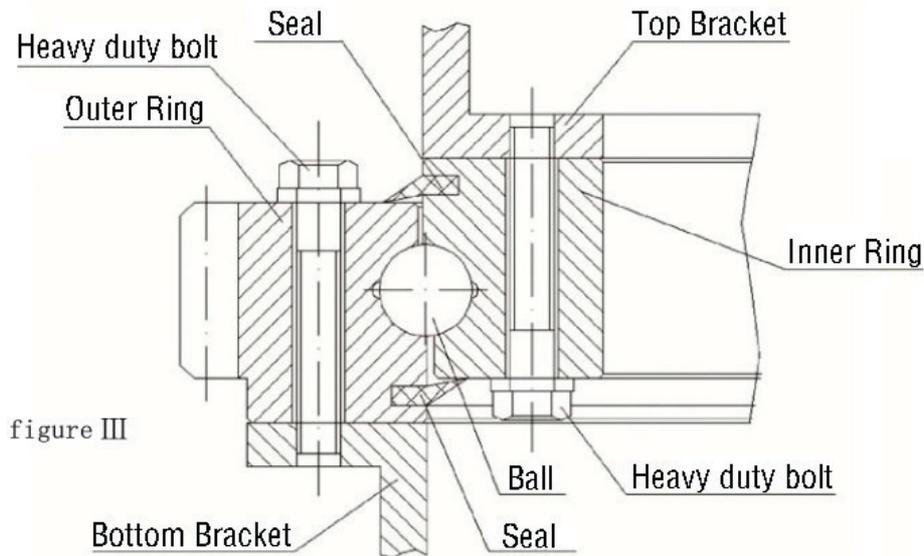

Table II : Maximum Twisting Changeable Value Under Maximum Permissible Loading

Centering Diameter of Rolling Race D (mm)	~	>1000	>1500	>2000	>2500	>3000	>3500	>4000	>4500	>5000
	1000	~ 1500	~ 2000	~ 2500	~ 3000	~ 3500	~ 4000	~ 4500	~ 5000	~ 5500
Maximum Twist of Frame Plate Amax(mm)	0.6	0.8	1.0	1.2	1.5	2.0	2.5	3.0	3.5	4.0

Installing Requirement for Slewing Bearing

Table III : Permissible Plane Value Including Angular Deviation

Centering Diameter Of Rolling Race D_L (mm)	Plane Value of the Installation Frame		
	Single-Row four Ball Contact	Double-Row Ball Type	Roller Type
~1000	0.15	0.20	0.10
>1000~1500	0.19	0.25	0.12
>1500~2000	0.22	0.30	0.15
>2000~2500	0.25	0.35	0.17
>2500~4000	0.30	0.40	0.20
>4000~6000	0.40	0.50	0.30

Note: The value listed in table III are the maximum value. There is only one place permissible to reach this value in 180 ° of fan area. Meanwhile, It should be stably increased or decreased in these areas from 0 ° ~ 90 ° to 180 ° so as to avoid the peak value.

3、Installing:

Suspend and place down horizontally the Slewing bearing on the plane of frame installing fundamental basement. Use the plug gauge to check their contact condition. Fill in partially with placer if there is clearance.

The place marked “S” should be located at the non-loading area or nonalways loading area.

The specifications of bolts should be meet the standards of GB/T5782-2000 and GB/T5783-2000. Their strength class should not less than the regulation specified by class 8.8 of GB/T3098.1-2000. The strength class could be selected according to practical working condition and actual loads of the Slewing bearing would be born. It must make sure to have enough pre-tighten forces when installation. Generally, the pre-tighten force would be 0.7 times of the yield limit of bolt. (See table IV)

The fixture length of the bolt $LK \geq 5d$ (where: d is the diameter of the bolt). Please tight the bolts according to the sequences indicated in the figure IV. The specifications of screw nut should be met the need of GB/T6170-2000 and GB/T6175-2000. Their mechanical properties must meet the need of GB3098.2-2000. The spacer must meet the need of GB/T97.1-1985 and GB/T97.2-1985. They are all heat treated for temper hardening. It should not be used of any spring washers

Installing Requirement for Slewing Bearing

Table IV : Pre-Tightening Torque or Forces of Bolts

Specifications of the Bolts (GB/T5782-2000 GB/T5783-2000)	The Diameter of Installing Holes (mm)	Bolt's Strength Class (GB/T3098.1-2000)		
		8.8	10.9	12.9
		Yield Strength Limit of Bolt Material $\sigma_{smin}(N/mm^2)$		
		640	900	1080
Pre-tightening Torque $M_A(N \cdot m)$				
M10	11	44	62	75
M12	13.5	77.5	110	130
M14	15.5	120	170	210
M16	18	190	265	320

M56	62	863	1214	1457
M60	66	1008	1418	1621

Note: The total friction coefficient between the bolt head and tightening face

$\mu = 0.14$, It might be smeared a lot of soft oils on the thread location.

Operation and Maintenance of the Swing Bearing

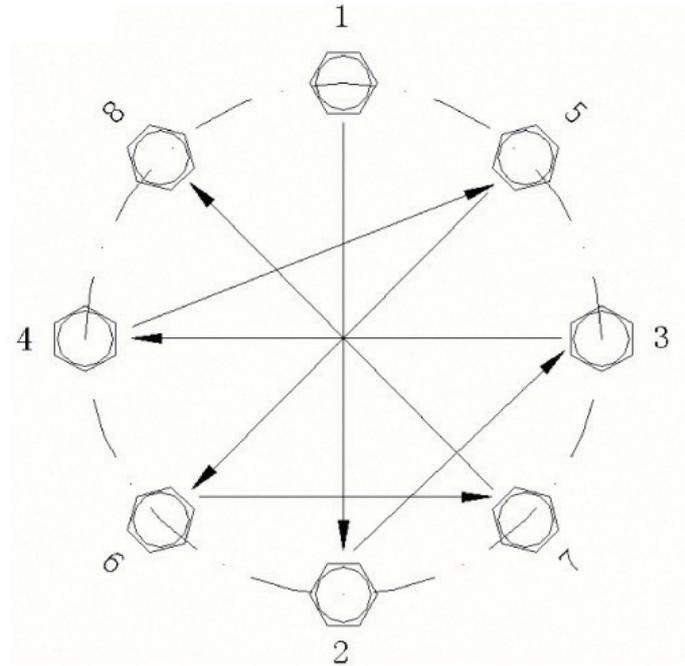

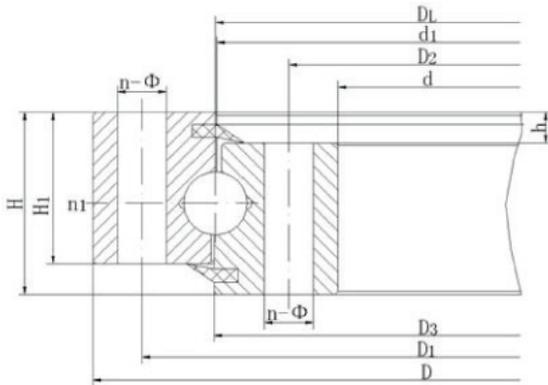

Figure IV

The Maintenance of the Swing Bearing

- ◆ The swing bearing had been filled with No.2 lithium based grease (GB7324-1994) in its rolling race before delivery. Generally, it is necessary to fill in grease once every 100 hours for ball type bearing, and once every 50 hours for roller type support. When filling in lithium based grease, it must make the revolving mechanism run slowly, and fill in the grease with its rotation, so as to make the grease even till the grease out off from the sealing place. The filling period should be shortened if there is the special working condition such as at the Torrid Zone, high humidity, severe dust, large temperature variation and long continuing working time.
- ◆ It should be filled with new grease before and after the machine being long time stop working.
- ◆ The gear faces exposed in air should periodically cleaned and spread with appropriate oil on it.
- ◆ Please check the pre-tighten force of the bolts after first 100 working hours of the slewing bearing. And after then check it once every 500 hours running. It must be always kept enough pre-tighten force.
- ◆ Stop and check the machine during operation if there is abnormal noise, vibration occurred or suddenly power rose. Remove the trouble or dismantle it for repairing if necessary.
- ◆ Shouldn't rinse directly the slewing bearing with water during operation so as to avoid the water entering to the rolling race.
- ◆ Shouldn't let the hard materials access or enter in the engaging area of the gear.
- ◆ Regularly check the seal ring is that ok or not. Replace it if it is damaged and reset it when it is fallen.

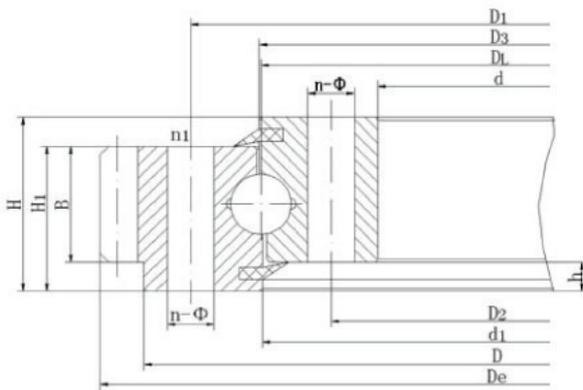

Single-Row Four Point Contact Without Gear Type 010

010

- 1, This series of slewing bearing is mainly made up of inside and outside rings. It features compact in design, and light in weight. The balls roll on the circular race at four points, via which the axial force, radial force and resultant torque may be transmitted simultaneously
- 2, The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940.1.

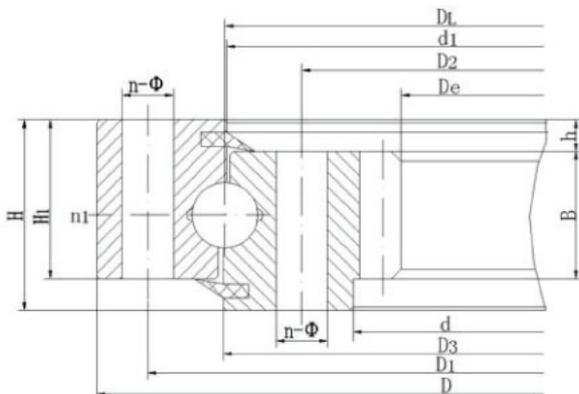

Single-Row Four Point Contact Outer-Gear Type 011/012

011/012

- 1, This series of slewing bearing are mainly made up of inside and outside rings. It features compact in design, and light in weight. The balls contact with the circular race at four points, via which the axial force, radial force and resultant torque may be transmitted simultaneously.
- 2, The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7904.2.
- 3, Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given Value.

Single-Row Four Point Contact Internal-Gear Type 013/014

013/014

- 1, This series of slewing bearing is mainly made up of inside and outside rings. It features compact in design, and light in weight. The balls contact with the circular race at four points, via which the axial force, radial force and resultant torque may be transmitted simultaneously.
- 2, The n_1 means the number lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940.1.
- 3, Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given value.

Double-Row Different Ball Diameter Type 020/021/022/023/024

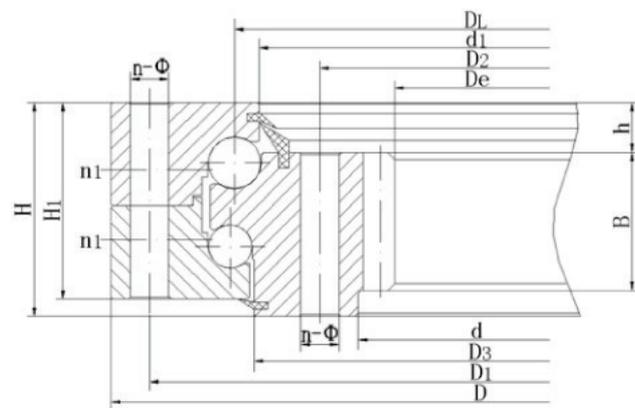

020

- 1、 This series of slewing bearing is mainly made up of inside and outside rings. It features compact in design, and light in weight. The balls roll on the circular race at four points, via which the axial force, radial force and resultant torque may be transmitted simultaneously
- 2、 The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940. 1.

021/022

- 1、 This series of slewing bearing is mainly made up of in-up rings, in-down rings and outside rings. The diameters of up-row and down-row balls are different; it is suitable for high precision mounting and capable to bear axial force, resultant torque and considerable large radial force. Its loading capabilities are better than single-row slewing rings.
- 2、 The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940. 1.
- 3、 Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given value.
- 4、 The recovery data of the gear given in the table are all of 0.5.

023/024

- 1、 This series of slewing bearing is mainly made up of in-up rings, in-down rings and outside rings. The diameters of up-row and down-row balls are different; it is suitable for high precision mounting and capable to bear axial force, resultant torque and considerable large radial force. Its loading capabilities are better than single-row slewing rings.
- 2、 The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940. 1.
- 3、 Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given value.
- 4、 The recovery data of the gear given in the table are all of 0.5.

Single-Row Cross Arranged Roller Toothless Type 110

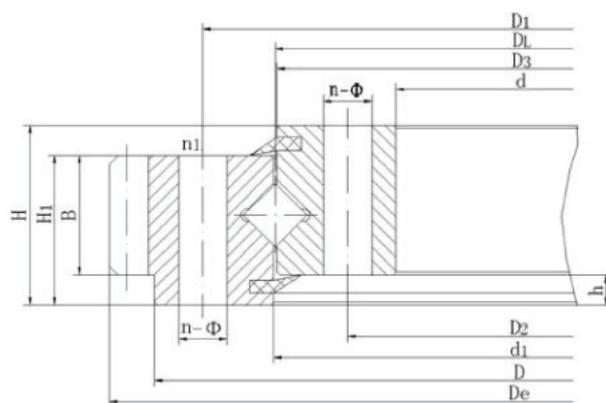

1. This series of slewing bearing is mainly made up of inside and outside rings. It features compact in design, light in weight, small in assembling clearance, and high in installing precision. As the rollers are crossed arranged by 1:1, it is suitable for high precision mounting and capable to bear axial force, radial force and resultant torque simultaneously.
2. The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940.1.
3. In the general work condition, we suggest that customer use the similar 010 series to instead of this series.

Single-Row Cross Arranged Roller Outer-gear Type 111/112

111/112

- 1、 This series of slewing bearing is mainly made up of inside and outside rings. It features compact in design, light in weight, small in assembling clearance, and high in installing precision. As the rollers are crossed arranged by 1:1, it is suitable for high precision mounting and capable to bear axial force, radial force and resultant torque simultaneously.
- 2、 The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940.2.
- 3、 Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given value.
- 4、 In the general work condition, we suggest that customer use the similar 011, 012 series to instead of this series.

Single-Row Cross Arranged Roller Internal-gear Type 113/114

113/114

1. This series of slewing bearing is mainly made up of inside and outside rings. It features compact in design, light in weight, small in assembling clearance, and high in installing precision. As the rollers are crossed arranged by 1:1, it is suitable for high precision mounting and capable to bear axial force, radial force and resultant torque simultaneously.
2. The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940.1.
3. Gear force of periphery given in the table is its maximum value, nominal force of periphery is taken 1/2 of the given value.
4. The series given in following table are our company's conventional types. We can also manufacture special type of products as customer's requirement.
5. In the general work condition, we suggest that customer use the similar 013,014 series to instead of this series.

Triple-Row Roller Type 130/131/132/133/134

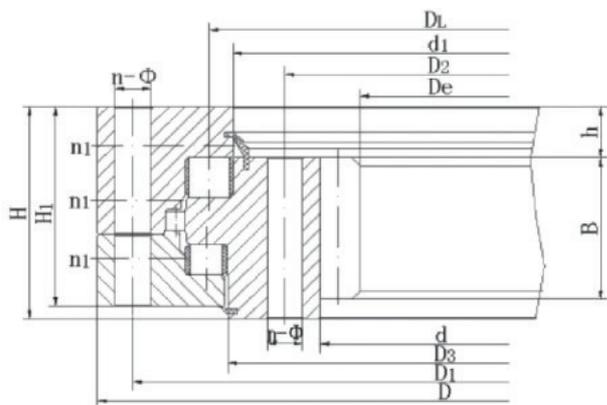

130

1. This series of slewing bearing is mainly made up of out-up rings, out-downrings and inside rings. It feature reasonable in design , high in working precision, and great in loading capabilities, it is suitable for high precision mounting and capable to bear axial force, resultant torque and considerable large radial force.
2. The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940. 1.

131/132

1. This series of slewing bearing is mainly made up of in-up rings, in-down rings and outside rings. It feature reasonable in design , high in working precision, and great in loading capabilities, it is suitable for high precision mounting and capable to bear axial force, resultant torque and considerable large radial force.
2. The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940. 1.
3. Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given value.
4. The recovery data of the gear given in the table are all of 0.5.

133/134

1. This series of slewing bearing is mainly made up of in-up rings, in-down rings and outside rings. It feature reasonable in design , high in working precision, and great in loading capabilities, it is suitable for high precision mounting and capable to bear axial force, resultant torque and considerable large radial force.
2. The n_1 means the number of lubricating holes, evenly distributed, lubricating nipple M10×1 JB/T7940. 1.
3. Gear force of periphery given in the table is its maximum value; nominal force of periphery is taken 1/2 of the given value.
4. The recovery data of the gear given in the table are all of 0.5.
